

## A temporary road stud for traffic delineation

A tested and certified BSEN 1463 temporary road stud which utilises the latest technology. Safemark combines a prismatic reflector system and fluorescent pigmented body to give maximum day and night-time visibility.

This raised all-weather marking system has been used in countless temporary traffic management schemes throughout the U.K.

It is available in various configurations to make life simpler for contractors - the ease of installation is a big bonus in restricted traffic management situations.

Safemark is available with two adhesive systems, making it suitable for most surfaces. Polymer Modified Adhesive often referred to as "hot melt" by contractors is recommended for use on all surfaces (though care is needed since residual marks remain after removal of studs). The self adhesive system is recommended where it is essential to avoid leaving marks.
